A database uses a 400G optical module

Overview

A 400G optical module performs photoelectric conversion: With a 400 Gbps transmission rate, these modules support industry evolution from 100M → 1G → 25G → 40G → 100G → 400G → 1T. They form the backbone of high-throughput data center networks and AI clusters. 400 Gigabit Ethernet (400G) transceivers are optical modules capable of handling data rates of 400 Gbps. 400G. With increasing demand for higher bandwidth, lower latency, and efficient data center interconnects, 400G optical modules have become essential. Vendors and infrastructure builders now have many options—QSFP-DD, OSFP, QSFP112 form factors; SR, LR, DR, FR, ZR reach categories; and even breakout and. PAM4 (4-Level Pulse Amplitude Modulation): This is the predominant modulation technique used in 400G modules. PAM4 allows each symbol to represent two bits of information, effectively doubling the data rate compared to traditional NRZ (Non-Return-to-Zero) modulation 1.
