Fiber optic connector bonding angle defect

Overview

In fiber connectors, for example, particles or defects at the contact point can raise insertion loss, increase reflectance (reduce return loss), and permanently scratch the opposing fiber in a connector. Fusion splicing suffers when cleave angles are excessive. A very common problem is that a connector is not fully engaged - often hard to notice in a crowded patch panel. Or it could be caused by the quality of the connector itself, such as poor end-face geometry that doesn't pass the parameters defined by IEC PAS 61755-3 standards, including angle of the. Fiber optics is generally quite sensitive; tiny defects and even low levels of contamination on fiber endfaces can substantially degrade device and system performance. It is then cut at various locations and terminated at the approximate longitudinal. This article explores the importance of key parameters—Radius of Curvature, Apex Offset, and Fiber Height—and methods to achieve high-quality end-face geometry. They act as reflection and scattering sites thereby.
