Cold aisle temperature in computer room

Overview

Hot Aisle vs Cold Aisle Containment Explained (Data In this guide, we'll break down how hot aisle and cold aisle configurations work, what containment syst.

Key Takeaways

Cold aisles in data centers should maintain IT equipment intake air temperatures between 18°C and 27°C (64°F to 81°F) according to ASHRAE guidelines.

Recommended Temperature Range

The American Society of Heating, Refrigerating and Air-Conditioning Engineers (ASHRAE) recommends that the intake air temperature at the front of IT equipment in cold aisles be maintained between 18°C and 27°C (64°F to 81°F) for optimal performance and reliability. This range ensures that servers, storage, and networking equipment operate efficiently without overheating or excessive energy consumption. Best Practices for Cold Aisle ManagementHot/Cold Aisle Layout: Cold aisles are formed between the fronts of two rows of IT racks, where the equipment draws in chilled air.

Hot aisles are located behind the racks to collect exhaust air. Airflow Control: Use perforated floor tiles or dedicated ducting to direct chilled air from the raised floor plenum to the cold aisle. Ensure that airflow is not obstructed by cables, paper, or other objects.

Containment Systems: Cold aisle containment (CAC) can improve efficiency by physically enclosing the cold aisle, preventing mixing with hot air and maintaining consistent intake temperatures. Monitoring: Install temperature sensors along the front of racks to monitor intake air. Even a small change in sensor placement can significantly affect measurement accuracy.

Equipment Specifications: Always verify that the inlet air temperature meets the manufacturer's specifications for each piece of IT equipment, as exceeding these limits can reduce reliability.

Additional Considerations

Altitude Adjustments: If the data center is at a high altitude, temperature and airflow requirements may need adjustment to maintain proper cooling. Heat Load Management: Modern data centers are typically designed to handle up to 3 kW per cabinet, but airflow distribution must be balanced to avoid hotspots. Energy Efficiency: Proper cold aisle management reduces energy consumption by minimizing the need for overcooling and improving CRAC unit efficiency.

Maintaining the recommended cold aisle temperature range and implementing effective airflow management strategies ensures IT equipment longevity, operational reliability, and energy-efficient cooling in computer rooms.
