Direct-reading spectrometer malfunction

Overview

Fault Causes: Insufficient light emission from the source, damaged or dusty detector, misaligned or shifted optical path. Direct-reading spectrometers are precision analytical instruments used in metallurgy, casting, and metallic materials testing. They can rapidly detect the content of elements such as carbon, sulfur, phosphorus, silicon, and manganese in metallic materials, featuring high detection speed and high. Direct reading spectrometers often encounter some minor faults during use. If the manufacturer can not arrive in time, we can try to solve them ourselves. Some problems are really simple. The negative high voltage of our direct reading spectrometer cannot be added?

How to solve it?

The main. Most spectrometer problems stem from three things: incorrect calibration, poor sample prep, or hardware wear.
