Original optical module wavelength

Overview

O band: O band is the original band, with a wavelength range of 1260nm-1360nm. Optical modules typically have an electrical interface on the side that connects to the inside of the system and an optical interface on the side that connects to the outside. Digital Diagnostic Monitoring is a technology that enables real-time monitoring of various parameters in optical modules. These parameters include operating voltage, operating temperature, received optical power, transmitted optical power, and laser bias current. The center wavelength determines the operational band, aligned with low-loss windows in silica fiber. Due to process and production variations, different types of lasers or the same type of laser may have differences in central wavelength.
