OTDR has a simpler testing principle than optical power meters

Overview

The OTDR is the only practical tool for finding where a fault is on a long dark fiber. "Fiber testing often raises a common question: Should you use an OTDR or a power meter?

Although both tools measure optical performance, they serve very different purposes. Understanding when to use each tool can save time, prevent misdiagnosis, and ensure accurate test results. What Does a Power. An Optical Time Domain Reflectometer (OTDR) injects optical pulses into a fiber and analyzes the returning backscatter and reflected light. It can provide information about: In simple terms: OTDR tells you: “Where is the problem and what type of event caused it?

” Typical applications: Fiber fault location . This guide compares three core instruments — the OTDR (Optical Time Domain Reflectometer), the optical power meter (used with a light source), and the Visual Fault Locator (VFL) — so you can choose the right method and combine them in a professional workflow.
