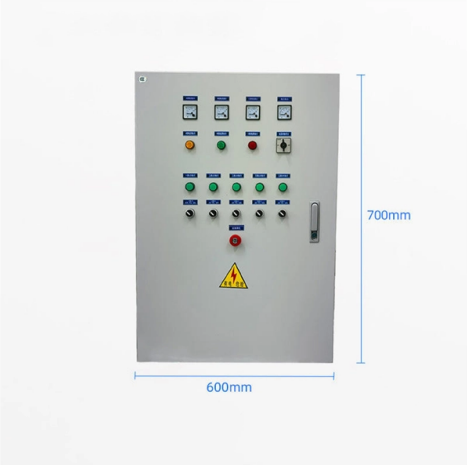
Performance metrics for optical receivers



Overview

Ensure reliable optical transceiver performance with regular tests for metrics like BER, extinction ratio, and receiver sensitivity to avoid network disruptions.

Key Takeaways

Key performance indicators of optical receivers include receiver sensitivity, bit error rate (BER), signal-to-noise ratio (SNR), Q-factor, and the impact of noise and inter-symbol interference (ISI) on signal quality.

Receiver Sensitivity

Receiver sensitivity is the minimum average optical power required for the receiver to achieve a specified BER, typically ({10}^{-9}) or ({10}^{-12}), and is measured in dBm. Higher sensitivity allows detection of weaker signals, enabling longer transmission distances and more reliable data transfer. Sensitivity is influenced by detector characteristics, amplifier design, and noise sources, and is a critical factor in determining the system power budget and link performance.

Bit Error Rate (BER)BER quantifies the number of erroneous bits received relative to the total transmitted bits. It is a direct measure of receiver performance and signal integrity. A lower BER indicates better performance and is closely tied to receiver sensitivity and SNR.

BE

R is often used in conjunction with Q-factor to evaluate optical signal quality.

Signal-to-

Noise Ratio (SNR)SNR represents the ratio of signal power to noise power at the receiver. A higher SNR indicates better signal quality and lower BER.

SN

R is affected by random noise, thermal noise, shot noise, and relative intensity noise (RIN) from the transmitter.

Optimizing SN

R is essential for maintaining high-quality optical communication. Q-FactorThe Q-factor is a figure of merit that measures the vertical eye opening relative to RMS noise in the presence of ISI. It provides a practical way to relate signal quality to BER.

A higher Q-factor corresponds to a lower BER and better receiver performance. Q-factor reduction due to ISI or noise can result in optical power penalties or an error floor in system performance.

Inter-

Symbol Interference (ISI) and JitterISI occurs when previous symbols interfere with the current symbol, degrading the eye diagram and reducing the Q-factor. Timing jitter from clock recovery circuits can further impair signal detection.

Both IS

I and jitter contribute to power penalties and must be minimized through careful receiver design and signal conditioning.

Detector and Amplifier Characteristics

The photodetector converts optical signals into electrical signals, and its performance metrics—quantum efficiency, responsivity, and dark current—directly affect sensitivity. The transimpedance amplifier (TIA) and limiting amplifier amplify the signal but can introduce additional noise, impacting SNR and BER. Optimizing these components is crucial for high-performance optical receivers.

Summary

In summary, the most important performance indicators of optical receivers are: Receiver sensitivity (minimum detectable optical power for a given BER)Bit error rate (BER)Signal-to-noise ratio (SNR)Q-factor (eye opening relative to noise)Impact of ISI and jitterDetector and amplifier characteristics Understanding and optimizing these parameters ensures reliable, high-speed, and long-distance optical communication system performance.

Article Content

Receiver Performance

Receiver performance is defined as the effectiveness of user equipment (UE) receivers in enhancing link efficiency, user experience, and capacity, which can be improved through advanced equalization

How to Ensure Reliable Optical Transceiver Performance

Ensure reliable optical transceiver performance with regular tests for metrics like BER, extinction ratio, and receiver sensitivity to avoid network disruptions.

HFAN-03.0.2: Optical Receiver Performance Evaluation

This application note provides an in-depth analysis of the complete receiver optical sensitivity and the potential power penalties related to the accumulation of random noise and inter-symbol interference

The key points for optimizing the performance of optical modules

The key performance metrics that affect the performance of optical modules include average transmit optical power, extinction ratio, optical signal central wavelength, overload optical

Optical receiver performance evaluation

When designing a good optical receiver, it is critical to understand the different parameters that will impair overall receiver sensitivity.

How to Measure the Performance Indicators of Optical Modules?

Explore the working principles, performance indicators, and advantages of optical modules, with a focus on FS 25G modules. Learn about protective measures against failure for

Optical Module Performance: Key Power and Sensitivity Metrics

This article provides an in-depth analysis of two key performance indicators of optical modules: transmitter power and receiver sensitivity.

Understanding Optical Modules: Working Principles, Structures, and ...

Explore the working principles, structures, and performance metrics of optical modules, essential components of optical fiber communication systems. Learn about key indicators such as

Receiver Sensitivity

© 2026 AK OPTICAL SYSTEMS - All rights reserved

Receiver sensitivity refers to the minimum input optical power required by the receiver to achieve a specified bit error rate (BER). A larger receiver sensitivity indicates poorer receiver performance.

Minimum Receiver Power vs. Receiver Sensitivity: A Guide to Optical ...

When working with optical modules, two key receiver parameters frequently appear in technical specifications: Minimum Receiver Power and Receiver Sensitivity. Understanding what

Mastering Receiver Sensitivity in Optical Communications

Discover the importance of receiver sensitivity in optical communications and learn how to optimize it for better signal quality and reliability.

Optical receiver performance evaluation

An essential parameter in determining the system power budget in an optical transmission system is optical receiver sensitivity, defined as the minimum average optical power for

Optical Receiver Performance

The receiver performance is characterized by measuring the BER as a function of the average optical power received. The average optical power corresponding to a BER of 10-9 is a measure of receiver

Performance of Optical Receivers Using Photodetectors With Different ...

In this paper, we analyze the performance of optical receivers using photodetectors (PDs) with two different fields of view (FOVs) in a multiple-input multiple-output optical wireless

COHERENT OPTICAL RECEIVERS AND IDEAL PERFORMANCE

COHERENT OPTICAL RECEIVERS AND IDEAL PERFORMANCE Coherent detection of optical signal is first used for its superior re- ceiver sensitivity compared to on-off keying. Equivalently speaking, the

Optical Receiver Configuration and Performance

This document provides an overview of optical receiver operation for digital signal transmission. It discusses the fundamental components and processes in a digital optical receiver including digital

Optical Performance Monitoring: A Review of Current and Future ...

Optical performance monitoring (OPM) is the estimation and acquisition of different physical parameters of transmitted signals and various components of an optical network. OPM

© 2026 AK OPTICAL SYSTEMS - All rights reserved

Performance Monitoring and Measurement Techniques for Coherent Optical ...

Modern spectrally efficient optical communication systems utilize polarization-multiplexed coherent transmission in complex modulation format. Coherent receivers used in these systems measure the
