S-shaped bend in optical cable

Overview

S-shaped bends are widely used to realize lateral displacements and connections in integrated optical devices, such as the directional couplers, optical switches and arrayed waveguide gratings (AWGs). Bend losses are additional propagation losses that optical fibers exhibit when they are bent. This can be explained by coupling of light from core modes. Fiber optic cable bend radius is a critical mechanical parameter that determines how sharply a cable can be bent without risking microbending, macrobending, signal loss, or long-term structural fatigue. In this paper, the loss mechanism of the S-shaped bend is briefly. Light energy is converted to heat by impurities (OH^- ions, metal contaminants like Cu^{2+}/Cr^{3+}). Peaks at 1380 nm (OH^- absorption) and 950/1250 nm., Corning® SMF-28 Ultra:
