Why do high-voltage switchgear need small busbars

Overview

Low-voltage switchgear focuses on current and heat, while medium- and high-voltage systems require more insulation and spacing. Busbars must work smoothly with circuit breakers and protection devices. A busbar is a metal bar, usually made of copper or aluminum, that carries electricity inside switchgear. It connects. In electric power distribution, a busbar (also bus bar) is a metallic strip or bar, typically housed inside switchgear, panel boards, and busway enclosures for local high current power distribution, transmission, or switching substations. Good busbar design cuts losses, improves reliability, and supports flexible operation in systems like GGD Low Voltage. Core idea: A busbar is a conductive bar or assembly that creates a common current distribution point inside electrical equipment.
