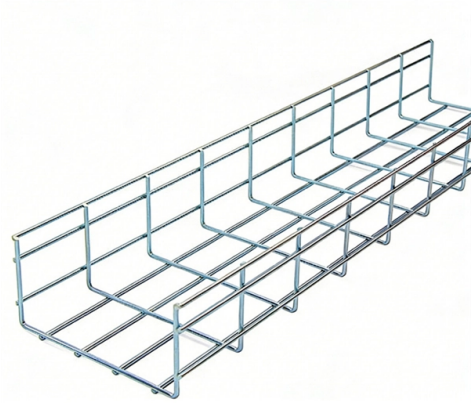
How to back up an access switch



Overview

Using the switch CLI, you can specify the IP addresses of the backup switchs, which allows the access points to fail over to switchs outside of the mobility group.

Key Takeaways

Backing up an access switch involves saving its current configuration to a secure location using CLI, GUI, or network-based methods to ensure quick recovery and continuity. General Steps for Backing Up a Switch1.

Identify the Switch Type and Access Method

Determine the vendor (Cisco, Aruba, Ruckus, etc.) and the model. Decide whether you will use CLI (command-line interface), GUI (web interface), or network-based protocols like TFTP, FTP, SCP, or SFTP for backup. 2.

Backup via CLI (Common for Cisco Switches)Connect to the switch via console or SSH. Enter privileged mode using enable. Save the running configuration to the startup configuration: copy running-config startup-config.

Copy the configuration to a remote server: TFTP: copy running-config tftp: and provide the server IP and filename. FTP/SCP/SFTP: Configure credentials (ip ftp username/password) and use copy running-config ftp: or scp: to transfer the file. Verify the backup file exists on the server before making changes or upgrades to the switch.

3. Backup via GUI (Common for Aruba and Ruckus Switches)Aruba Central: Navigate to System Management > Backup and Restore, select Backup Now, specify the server and protocol (SFTP recommended), and confirm the backup. Ruckus Switches: Go to Wired > Switches > Switch List, select the switch, click Backup Now, optionally name the backup, and monitor the progress.

Aruba WebUI: Use Configuration Audit > Configuration Backup & Restore, create a new backup, and confirm to save the configuration template. 4. Automate Backups (Optional)For Cisco, use Kron jobs (if supported) to schedule periodic backups.

For Aruba and Ruckus, schedule automatic backups through the management platform to maintain up-to-date configuration snapshots. 5.

Verify and Secure Backups

Ensure the backup file is complete and accessible. Store backups in a secure location with restricted access. Maintain multiple versions to allow rollback in case of configuration errors or hardware failure.

6.

Restore Procedure

To restore, copy the backup file from the server to the switch using the same protocol. Apply the configuration to the running or startup configuration and save changes. Confirm the switch operates correctly after restoration.

By following these steps, you can safeguard your access switch configurations, minimize downtime during failures, and maintain network stability.
