Internal heating sensing optical cable

Overview

AP Sensing''s fiber optic sensor cables enable real-time, precise monitoring of temperature, strain & acoustics in harsh environments with minimal maintenance.

Key Takeaways

Internal heating sensing optical cables use fiber optics as distributed temperature sensors, enabling precise, real-time monitoring over long distances and in harsh environments.

How They Work

Internal heating sensing optical cables rely on Distributed Temperature Sensing (DTS) technology, where the optical fiber itself acts as the sensor. A light pulse is sent through the fiber, and temperature changes along the cable are detected by analyzing the backscattered light caused by variations in the fiber's refractive index due to heat. This allows continuous temperature measurement along the entire length of the cable, rather than at discrete points, providing high-resolution thermal profiles.

Cable Construction

Fiber optic sensor cables typically consist of three main components: the core, cladding, and coating. The core carries the light, while the cladding ensures total internal reflection, keeping the light contained. Coatings protect the fiber and can be tailored for specific temperature ranges: polyacrylate for standard conditions, polyimide or metal for high-temperature or cryogenic environments.

Cables may be metal-free for flexibility and reduced induced voltages or armored for mechanical protection in harsh environments. Advantages Over Traditional SensorsLong-distance monitoring: DTS cables can measure temperature over kilometers without the need for multiple discrete sensors. High resolution and accuracy: Thousands of temperature points can be measured along a single fiber.

Electromagnetic immunity: Optical fibers are immune to electromagnetic interference, making them suitable for industrial and high-noise environments. Safety in hazardous areas: Passive fiber optic cables can be used in explosive or high-risk zones without electrical hazards.

Applications

Internal heating sensing optical cables are widely used in: Fire detection in tunnels, cable trays, and industrial plants. Preventive maintenance for equipment by detecting abnormal temperature rises. Power infrastructure monitoring, such as underground cables and transformer stations.

Industrial process monitoring, ensuring temperature uniformity and early detection of overheating.

Specialized Designs

Some systems, like the DTSX1, offer armoured cables capable of monitoring up to 16 kilometers per cable with rapid heat detection and compliance with standards like EN 54-22 for fire detection. Other designs, such as Luna's DE.

TEC

T, include dual-fiber tubes with tailored coatings and optional stranded wire layers for enhanced mechanical robustness and fast temperature response. In summary, internal heating sensing optical cables provide a reliable, high-resolution, and safe solution for continuous temperature monitoring across large areas and challenging environments, outperforming traditional electrical sensors in both range and safety.

Fiber Optic Sensor Cables for Advanced Monitoring | AP Sensing

AP Sensing''s fiber optic sensor cables enable real-time, precise monitoring of temperature, strain & acoustics in harsh environments with minimal maintenance.

Linear Heat Detection Sensor Cable

One vital component in the DE.TECT smart sensor design is a tube that accommodates 2 optical fibers. The coating of the optical fiber can be tailored to

Linear Heat Detection Fiber Optic Cable with Armoured Tube

© 2026 AK OPTICAL SYSTEMS - All rights reserved

This kind of cable is widely used in distributed temperature sensing systems where fire safety is at a high priority. Technical Details

Linear Heat Detector Cable & Distributed Temp Sensing

In the Digital Temperature Sensing cable, an optical laser pulse is continuously sent through the fiber optic cable, which results in scattered light reflecting back to the

CN120630417A

The present invention relates to the field of optical cable technology, and provides a self-heating temperature-sensing optical cable and a wiring harness assembly.

Linear Heat Detection Cables (Fiber Optic) | ATP Solutions

Fiber optic sensor cables can be used not only for data transmission, but also for measuring temperature, strain, and acoustic signals, even in harsh environments.

DTSX1 Fiber Optic Linear Heat Detection

This system is a cost-effective choice for monitoring large areas, capable of rapid heat detection across lengths up to 16 kilometres per cable. Crucially, it is resistant to electromagnetic interference,

Fiber Optic Linear Heat Detection (LHD) | Raman-OTDR | AP Sensing

Utilizing certified fiber optic LHD cables as continuous temperature sensors, this system responds to heat at any point along the cable, detecting hotspots and fires with remarkable precision.

Fiber Optic Sensing Cables • NBG Fiber Optics

Built for robustness, these cables offer superior rodent protection and versatility for direct burial or aerial installation, enabling precise and rapid measurements across an extensive temperature range from

Patol Fiber Optic Linear Heat Detection Cable (Fire

Patol fiber optic heat detection cable provides accurate, reliable and intelligent fire and heat detection as well as asset monitoring for installations around the world.

Principles of Distributed Temperature Sensing

Dive into the principles of Distributed Temperature Sensing (DTS) with Silixa. Explore optical fiber technologies for diverse environmental applications.

Patol Fiber Optic Linear Heat Detection Cable (Fire

Patol Fiber Optic Linear Heat Detection Cable Product Construction Patol fiber optic linear heat detection cable offers many important advantages as a sensing
