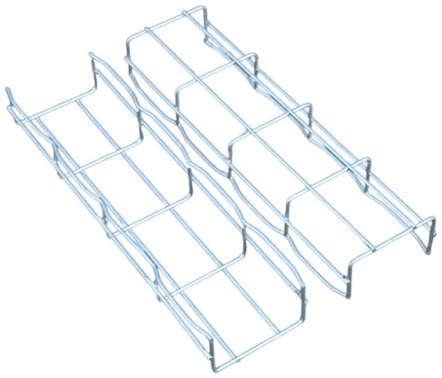
Is it good to install side panels on cold aisle server racks



Overview

Empty cabinets and empty rack unit positions can allow hot air to migrate into the cold aisle, causing unwanted temperature issues. Using blanking panels and side panels mitigates this. The basic principle is straightforward. Hot air can get. Sealing the open gaps in server racks is a well-known best practice when implementing airflow management improvements in a data center. Blanking panels decrease server inlet air temperatures and increase the temperature of air returning to the CRAC, both of which improve operational. While advanced cooling systems like chilled water plants and CRAH units play a major role, one of the most effective strategies is much simpler: controlling how air moves through the data hall. Various components can be used, including panels, curtains, doors, seals, and blanking panels.
