Fiber Optic Leased Line Router

Overview

Also know as "Full Fibre", or "Fibre Ethernet" it refers to a leased line connection that uses fibre-optic cables from end to end, ensuring high-speed and reliable internet connectivity.

Key Takeaways

Yes, a router is generally required for a fiber optic leased line to manage your network and distribute the connection to devices. Why a Router is NeededA fiber optic leased line provides a dedicated, uncontended connection directly to your premises, delivering guaranteed bandwidth and symmetrical speeds. While the leased line itself ensures high-speed connectivity, the router serves as the interface between the leased line and your internal network, converting the incoming signal from the Optical Network Terminal (ONT) into usable IP traffic for your devices.

Without a router, you cannot efficiently manage multiple devices, implement security policies, or create a local network. Equipment Provided by the ISPMany leased line providers supply a fiber-ready router or a managed router as part of the service. For example, some businesses receive routers like the Cisco ISR series, which are capable of handling high bandwidth and advanced features such as VLANs, traffic prioritization, and failover configurations.

If your organization has specific requirements, such as multiple VLANs or high user counts, you may need a more advanced router than the one supplied.

Optional Scenarios

Single device connection: Technically, if only one device needs internet access, you could connect it directly to the ONT, but this is uncommon in business environments. Multiple devices or Wi-Fi: A router is essential to distribute the connection, manage IP addresses, and provide security features like firewalls and NAT. Bandwidth management: Routers allow you to control traffic, prioritize critical applications, and monitor usage, which is particularly important for leased lines with high-speed, guaranteed bandwidth.

Conclusion

While the leased line itself provides a dedicated fiber connection, a router is necessary to manage, distribute, and secure the network. Most providers include a suitable router, but depending on your network size and requirements, you may need to upgrade to a more capable model to fully utilize the leased line's performance.
