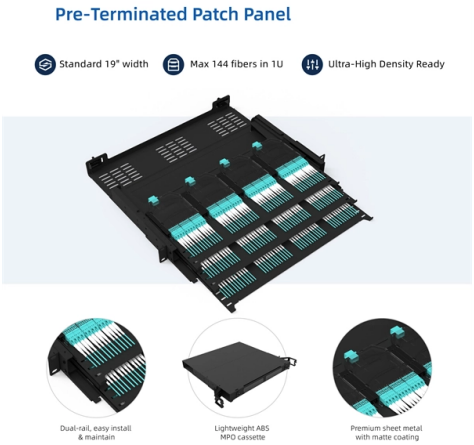
Monitoring Switch Access Devices



Overview

Use Automated switch port mapping, PoE management, Configuration management, and pre-configured SNMP templates to monitor your switches, firewalls, and access points. It involves observing the activity on individual switch ports to gather data regarding network traffic, detect potential. These ports are the ones monitored when implementing port monitoring — a subcategory of switch monitoring focused on assessing the performance of individual ports rather than just the switches themselves. They're the ones making sure your data gets from A to B without doing the digital equivalent of taking the scenic route or getting lost in cyberspace. Yet, abnormal traffic patterns, intermittent port failures, and PoE issues can quickly degrade performance. Real-Time Alerts: You can set up real-time alerts for various parameters (such as port status or network. Monitoring your network is absolutely essential as it can help to thwart attacks and address problems before they translate to financial loss for your organization.
