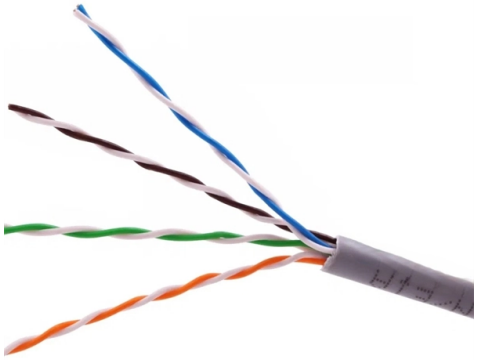
Multimode fiber um represents



Overview

Identified by ISO 11801 standard, multimode fiber optic cables can be classified into OM1 fiber, OM2 fiber, OM3 fiber, OM4 fiber and newly released OM5 fiber.

Key Takeaways

In multimode fiber, "um" represents micrometers (µm), which is the unit used to measure the fiber's core diameter. In the context of multimode fiber (MMF), "um" or µm stands for micrometer, a unit of length equal to one-millionth of a meter. Multimode fibers have larger core diameters, typically 50 µm or 62.5 µm, compared to single-mode fibers, which have cores around 8–10 µm.

The core diameter determines how many light modes can propagate through the fiber: a larger core allows multiple modes, enabling short-distance, high-bandwidth communication within buildings, campuses, or data centers. Core Diameter and Fiber TypesOM1: 62.5 µm core, typically orange jacket, uses LED light sources, suitable for legacy networks and short distances up to 33 meters at 1 Gbps. OM2: 50 µm core, supports 1G Ethernet and limited 10G applications.

OM3/OM4/OM5: 50 µm laser-optimized cores, designed for higher-speed applications (10G–100G) over longer distances (up to 550 meters for OM5) using VCSELs or SWDM light sources.

Importance of Core Size

The core diameter in micrometers affects: Bandwidth and data rate: Larger cores can carry multiple light modes but are limited by modal dispersion, reducing maximum distance at high speeds. Cost and installation: Multimode fiber with larger cores is easier to align and terminate, making it more cost-effective for short-range networks. Compatibility: Different OM types are standardized (OM1–OM5) to ensure predictable performance for specific applications.

In summary, "um" in multimode fiber specifications indicates the core diameter in micrometers, which is a key factor in determining the fiber's performance, distance capability, and suitable applications in modern optical networks.

Guide To Multimode Fiber (62.5um & 50um, OM1 to OM5)

Multimode fiber optic cable (or glass) is a common specification of optical fiber that offers a much wider core size or core diameter of 50-62.5 microns (µm)

Multimode Fiber Types: OM1 vs OM2 vs OM3 vs OM4 vs OM5

Identified by ISO 11801 standard, multimode fiber optic cables can be classified into OM1 fiber, OM2 fiber, OM3 fiber, OM4 fiber and newly released OM5 fiber. The next part will compare

OM1 vs OM2 vs OM3 vs OM4 vs OM5 Multimode Fiber Guide

Compare OM1, OM2, OM3, OM4, and OM5 multimode fiber specs, distances, bandwidth, and applications. Essential guide for data center fiber selection.

Multimode Fiber Cable Types: OM1/OM2/OM3/OM4/OM5 Compared

Compare all five multimode fiber grades — OM1 through OM5 — with full specs, bandwidth, distance limits, and real-world data center use cases. Learn which grade fits your

Multi-mode optical fiber

Multi-mode optical fiber is a type of optical fiber mostly used for communication over short distances, such as within a building or on a campus. Multi-mode links can be used for data rates up to 800 Gbit/s.

Single Mode vs. Multimode Fiber: Core Differences and Selection Guide

Single mode fiber typically has a core diameter of about 9 µm, which allows only one mode of light to propagate. In contrast, multimode fiber has a larger core, usually 50 µm or 62.5 µm,

A Guide to Multimode Fiber Types (OM1-OM5) – trueCABLE

© 2026 AK OPTICAL SYSTEMS - All rights reserved

Multimode fiber typically has a 50µm (micron) core that enables multiple light modes to be propagated. Because of this, more light can pass through the multimode fiber core at a given time.

Multimode Fiber Types: OM1 vs OM2 vs OM3 vs OM4

A complete guide to multimode fiber types OM1, OM2, OM3, OM4, and OM5. Compare speed, distance, bandwidth, and applications, and learn how

Multimode Optical Fiber Selection & Specification

The OM fiber classification is often referenced in both LAN and DC applications. In general, the higher the OM numerical digit, the higher the system performance one can expect from that particular fiber

Multimode Fiber: OM1 to OM5 – MapYourTech

This comprehensive guide explores the five primary categories of multimode fiber—designated as OM1, OM2, OM3, OM4, and OM5—each representing progressive

Multimode Optical Fiber Selection & Specification

All multimode fibers utilizing the above nomenclature should be graded-index MMF and compliant with industry prevailing standards and terminology for optical fiber.

Single Mode vs. Multimode Fiber Optic Cables

There are two main types of fiber optic cables: single mode and multimode. Although they can do the same job in some instances, the different

Multimode Fiber Guide: Differences Between OM1,

Fiber optic technology has transformed how data moves inside enterprise LANs, campus networks, and hyperscale data centers. Within fiber

Recognizing Multimode Fiber Types by Color

Color-coding is a big help when identifying individual fibers, cable, and connectors. For example, cable jacket color typically defines the fiber type, and can differ based on mode and performance level.

Multimode Fiber Optic Cable Types: OM1 vs OM2 vs OM3 vs OM4 vs

Multimode fiber optic cable types OM1, OM2, OM3, OM4 and OM5 compared for core size, bandwidth, speed, distance & applications in modern networks.

Fiber Optic Cable Types – Multimode and Single Mode

Single Mode Fiber Core Size: 8 – 9um Note: Core measurement is in microns (um) In General, Single Mode (SM) fiber is used for long distances or
