PoE Switch Power Parameters

Overview

PoE switches (Type 1) comply with the IEEE 802. 3af standard, which specifies the maximum power delivered over Ethernet cables. 4 watts of power per port, while PDs can consume up to 12. PoE: Power over Ethernet (PoE) is a technology that allows Ethernet cables to carry electrical power, along with data, to powered devices. Provides the guidelines for configuring PoE. The initial allocation for Class 0, Class 3, and Class 4. When working with your network devices, it's important to understand each device's power requirements and the types of Power over Ethernet (PoE) they support. By eliminating the need for separate power. This document describes all the configuration commands of the device, including the command function, syntax, parameters, views, default level, usage guidelines, examples, and related commands. Since its introduction in 2003.
