Quantum Optical Cable Line

Overview

With the new fiber optic test facility at the Karlsruhe Institute of Technology (KIT), which opened on January 22, 2025, researchers aim to transmit, test and refine quantum keys. They also plan to set up a quantum network to link quantum computers. For these cutting-edge applications, IDIL develops and produces high-precision optical delay management solutions for phase compensation, precision. Unlike binary bit based digital communications, quantum information is transmitted in qubits, which can store multiple values at once, making quantum communications more secure. A recently published article in Nature states that scientists have sent quantum information across a record-breaking 158. Quantum physics delivers the necessary foundation by allowing practicable technologies such as quantum key distribution.
