Storage FC interface speed

Overview

FC vs iSCSI vs SAS for Storage: What to Choose in 2026 ⚡Compare FC, iSCSI and SAS for connecting storage systems to servers, including latency, redundancy.

Key Takeaways

Fibre Channel (FC) storage interfaces support speeds ranging from 1 Gbps to 128 Gbps today, with emerging standards targeting 256 Gbps and 512 Gbps.

Overview of FC Speeds

Fibre Channel is a high-speed, low-latency, and lossless protocol primarily used in Storage Area Networks (SANs) to connect servers and storage systems. Over the years, FC has evolved through multiple generations, each increasing the data transfer rate: Legacy speeds: 1 Gbps, 2 Gbps, 4 GbpsModern speeds: 8 Gbps, 16 Gbps, 32 Gbps, 64 Gbps, 128 GbpsEmerging speeds: 256 Gbps and 512 Gbps are under development to meet growing data center demands These speeds are often denoted as Gigabit Fibre Channel (GFC), reflecting the gigabit-per-second data rate.

FC Transceivers and SF

P ModulesFC interfaces rely on optical transceivers (SFP, SFP+, SFP28, SFP56, QSFP28) to achieve these speeds. Each transceiver type is designed for specific FC speeds and network distances: SFP/SFP+: Common for 1–16 GbpsSFP28/SFP56: Supports 25–64 GbpsQSFP28: Used for 128 Gbps and beyond These transceivers ensure deterministic performance, low latency, and lossless data delivery, which is critical for mission-critical workloads such as databases, virtualization, and backup systems.

Performance Implications

Higher F

C speeds directly improve throughput and latency in SAN environments. For example: 16GFC and 32GFC are dominant in modern enterprise SANs, providing high bandwidth for SSDs and NVMe storage. 64GFC and 128GFC are increasingly adopted for large-scale data centers and high-performance computing, supporting NVMe over Fibre Channel (FC-NVMe) for ultra-low latency storage access.

The evolution of FC speeds ensures that storage networks can keep pace with faster storage media, including SSDs and NVMe devices, while maintaining lossless, in-order delivery of data.

Summary

Fibre Channel storage interfaces offer a wide range of speeds to accommodate both legacy and modern storage requirements. From 1 Gbps to 128 Gbps today, with 256 Gbps and 512 Gbps on the horizon, FC remains a high-performance, reliable choice for enterprise SANs, particularly where low latency and guaranteed delivery are essential.
