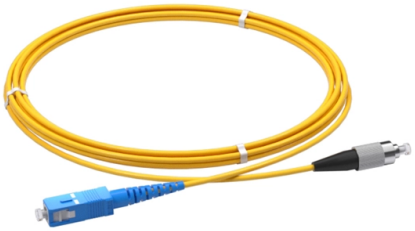
# Why refresh network security devices



## Overview

By proactively refreshing your hardware, you protect productivity, strengthen cybersecurity, and keep your infrastructure ready to support growth. Let's take a look at why that is, and go over some clear signs that it's time for your business to update your hardware and devices. Most SMB networks do not “fail” all at once. They slowly get unstable, slower, and riskier until one day you have an outage, a security incident, or a major productivity problem. Why refresh IT. Network infrastructure refresh is the planned replacement or upgrade of core networking equipment including switches, routers, firewalls, wireless access points, load balancers, and related network hardware. It's more than a one-time swap-out. For example, a company replacing its five-year-old workstations with newer models featuring faster processors, SSD storage, and upgraded security features experiences: Yet, many businesses delay hardware. Perhaps the most serious risk of delayed refresh cycles is security. Older devices often: your network. part of an ongoing program—not treated as one-off events. Proactive Replacement, Not Reactive Repair dramatically.
